

Download Answers To Graphing Linear Equations

Example 1: Graph the linear function f given by $f(x) = 2x + 4$ Solution to Example 1. You need only two points to graph a linear function. These points may be chosen as the x and y intercepts of the graph for example. When you are solving systems of equations (linear or otherwise), you are, in terms of the equations' related graphed lines, finding any intersection points of those lines. This page will show you how to solve two equations with two unknowns. There are many ways of doing this, but this page used the method of substitution.
