Background. Treatment guidelines for aphasia recommend intensive speech and language therapy for chronic (>6 months) aphasia after stroke, but large-scale, class 1 randomised controlled trials on treatment effectiveness are scarce. Whether Semantic Feature Analysis (SFA) is a new-to-you treatment or one you have been using for years, The Clinician's Guide to Semantic Feature Analysis for Aphasia will help you be consistent and creative in the clinical use of this treatment for anomia. Frontotemporal Lobar Degeneration (FTLD) is the neuropathological term for a collection of rare neurodegenerative diseases that correspond to four main overlapping clinical syndromes: frontotemporal dementia (FTD), primary progressive aphasia (PPA), corticobasal degeneration syndrome (CBS) and progressive supranuclear palsy syndrome (PSPS).
