

Download Biological Characterization Of Bone Tumors

During the past few years, a considerable number of monographs on bone tumors have been published. They are mainly restricted to bone tumors as clinical-pathological entities, since their diagnosis, more than that of other tumors, requires the interdisciplinary cooperation between orthopedic specialist, radiologist, and pathologist. During the past few years, a considerable number of monographs on bone tumors have been published. They are mainly restricted to bone tumors as clinical-pathological entities, since their diagnosis, more than that of other tumors, requires the interdisciplinary cooperation between orthopedic specialist, radiologist, and pathologist. Summary. Seven giant cell tumors of bone and four malignant fibrous histiocytomas were studied immunohistochemically with different monoclonal antibodies to the mononuclear phagocyte system (MPS), to HLA-DR antigens, and to a proliferation-associated nuclear antigen (KI-67), in order to clarify the role of macrophages in these tumors. Biological characterization of human bone tumors - VIII. Expression of HLA-DR antigens in bone tumors and tumor-like lesions. / Petzsch, M.; Vassallo, José; Roessner, A.; Zwadlo, G.; Sorg, C.; Vollmer, E.; Grundmann, E. In: Journal of Cancer Research and Clinical Oncology, Vol. 112, No. 2, 01.10.1986, p. 144-150.
