Infant cognitive development is the study of how psychological processes involved in thinking and knowing develop in young children. Information is acquired in a number of ways including through sight, sound, touch, taste, smell and language, all of which require processing by our cognitive system. Because math knowledge begins to develop at a young age to varying degrees, it is important to identify foundational cognitive and academic skills that might contribute to its development. This article presents a principle that is essential to building a wellness approach that uses public health prevention strategies to prevent Post Traumatic Stress Disorder (PTSD) and other psychiatric disorders that come from exposure to trauma. Intellectual giftedness is an intellectual ability significantly higher than average. It is a characteristic of children, variously defined, that motivates differences in school programming.
