

# Download Knowledge Based Configuration

KBE represents a merging of object-oriented programming, artificial intelligence, and computer aided design. KBE systems aim to capture product and process information to allow businesses to model engineering processes, and then use the model to automate all or part of the process. The twin goals of knowledge-based artificial intelligence (AI) are to build AI agents capable of human-level intelligence and gain insights into human cognition. This robust, knowledge-based authentication system allows financial services providers, card issuers, retailers and order processors to customize their risk exposure for each transaction. Register. If you are a new customer, register now for access to product evaluations and purchasing capabilities. Need access to an account? If your company has an existing Red Hat account, your organization administrator can grant you access.
