

# Download Quantum Information Processing

Quantum Information Processing is a high-impact, international journal publishing cutting-edge experimental and theoretical research in all areas of Quantum Information Science. Topics of interest include quantum cryptography and communications, entanglement and discord, quantum algorithms, quantum Quantum Information Processing. Heterogeneous spin systems for quantum computation seek to combine the strengths of their constituents: electron spins for fast, versatile and high-fidelity readout and control, and nuclear spins operating as well-shielded quantum bits for storage and processing information. Quantum information science is an area of study based on the idea that information science depends on quantum effects in physics. It includes theoretical issues in computational models as well as more experimental topics in quantum physics including what can and cannot be done with quantum information.
