

Download The Ancestors Tale A Pilgrimage To Dawn Of Evolution Richard Dawkins

Human evolution is the evolutionary process that led to the emergence of anatomically modern humans, beginning with the evolutionary history of primates—in particular genus *Homo*—and leading to the emergence of *Homo sapiens* as a distinct species of the hominid family, the great apes. The timeline of human evolution outlines the major events in the development of the human species, *Homo sapiens*, and the evolution of the human's ancestors. Speciation is about how species form. It is a major part of evolutionary biology. Darwin thought most species arose directly from pre-existing species. The history of Earth concerns the development of planet Earth from its formation to the present day. Nearly all branches of natural science have contributed to understanding of the main events of Earth's past, characterized by constant geological change and biological evolution.
